Data Manipulation

- Computer Architecture
- Machine Language
- Program Execution

Computer Architecture

- Central Processing Unit (CPU) or processor
 - Arithmetic/Logic unit versus Control unit
 - Registers
 - General purpose
 - Special purpose
- Bus
- Motherboard

CPU and main memory connected via a bus

Stored Program Concept

A program can be encoded as bit patterns and stored in main memory. From there, the CPU can then extract the instructions and execute them. In turn, the program to be executed can be altered easily.

Data Manipulation

- Computer Architecture
- Machine Language
- Program Execution

Terminology

- Machine instruction: An instruction (or command) encoded as a bit pattern recognizable by the CPU
- Machine language: The set of all instructions recognized by a machine

Machine Language Philosophies

- Reduced Instruction Set Computing (RISC)
 - Few, simple, efficient, and fast instructions
 - Examples: PowerPC from Apple/IBM/Motorola and ARM
- Complex Instruction Set Computing (CISC)
 - Many, convenient, and powerful instructions
 - Example: Intel

Machine Instruction Types

- Data Transfer: copy data from one location to another
- Arithmetic/Logic: use existing bit patterns to compute a new bit patterns
- Control: direct the execution of the program

Adding values stored in memory

- Step 1. Get one of the values to be added from memory and place it in a register.
- **Step 2.** Get the other value to be added from memory and place it in another register.
- **Step 3.** Activate the addition circuitry with the registers used in Steps 1 and 2 as inputs and another register designated to hold the result.
- **Step 4.** Store the result in memory.
- Step 5. Stop.

Dividing values stored in memory

- **Step 1.** LOAD a register with a value from memory.
- **Step 2.** LOAD another register with another value from memory.
- **Step 3.** If this second value is zero, JUMP to Step 6.
- **Step 4.** Divide the contents of the first register by the second register and leave the result in a third register.
- **Step 5.** STORE the contents of the third register in memory.
- Step 6. STOP.

The architecture of the machine: An example

Parts of a Machine Instruction

- Op-code: Specifies which operation to execute
- **Operand:** Gives more detailed information about the operation
 - Interpretation of operand varies depending on op-code

The composition of an instruction: An example

Decoding the instruction 35A7

A Simple Machine Language

Op-code Operand Description

- 1 RXY LOAD reg. R from cell XY.
- 2 RXY LOAD reg. R with XY.
- 3 RXY STORE reg. R at XY.
- 4 0RS MOVE R to S.
- 5 RST ADD S and T into R. (2's comp.)
- 6 RST ADD S and T into R. (floating pt.)

A Simple Machine Language (continued)

Op-code Operand		Description
7	RST	OR S and T into R.
8	RST	AND S and T into R.
9	RST	XOR S and T into R.
А	R0X	ROTATE reg. R X times.
В	RXY	JUMP to XY if $R = reg. 0$.
С	000	HALT.

An encoded version of the instructions

Encoded instructions	Translation
156C	Load register 5 with the bit pattern found in the memory cell at address 6C.
166D	Load register 6 with the bit pattern found in the memory cell at address 6D.
5056	Add the contents of register 5 and 6 as though they were two's complement representation and leave the result in register 0.
306E	Store the contents of register 0 in the memory cell at address 6E.
C000	Halt.

Data Manipulation

- Computer Architecture
- Machine Language
- Program Execution

Program Execution

- Controlled by two special-purpose registers
 - Program counter: address of next instruction
 - Instruction register: current instruction
- Machine Cycle
 - Fetch
 - Decode
 - Execute

The machine cycle

Decoding the instruction B258

This part of the operand identifies the register to be compared to register 0.

The program of adding stored in main memory ready for execution

Program counter contains

address of first instructions. CPU Main memory Address Cells Registers 15 A0 Program counter 0 6C A0 A1 Bus 16 A2 1 Program is stored in 6D A3 main memory 2 beginning at 50 A4 address A0. 56 A5 Instruction register A6 30 6E Α7 CO A8 F 00 Α9

Performing the fetch step of the machine cycle

a. At the beginning of the fetch step the instruction starting at address A0 is retrieved from memory and placed in the instruction register.

Performing the fetch step of the machine cycle (cont'd)

b. Then the program counter is incremented so that it points to the next instruction.
